Core Flows and Screens

The whole product revolves around one repeating loop: the coach adds a client → the client fills a form → the coach builds a plan → the client executes and checks in. Every screen below has to serve that loop.

The full flow

the core flow · 9 steps, two lanes

Steps 1 and 2 happen once per client. Steps 5 through 9 are the loop that repeats weekly or monthly — and that loop has to be the fastest thing in the product, because the coach will run it thousands of times.

Flow 1 — Coach signup

The rule here: ask for the minimum that gets him to the home screen, and collect the rest later when he needs it. Every extra field on the signup screen costs you coaches.

Screen one — create account (three fields only)

Field	Type	Required
Mobile number	Number + OTP verification over WhatsApp	✅
Full name	Text	✅
Password	Hidden text	✅

Use the mobile number, not email, as the primary identifier. In Egypt that's faster and more reliable, and verification goes straight to WhatsApp.

Screen two — coach profile (after login, skippable)

Field	Type	Why you need it
Photo / logo	Image upload	Appears to the client on the link and the form
Brand or page name	Text	This is what the client sees, not your personal name
Specialty	Multi-select: fat loss, muscle gain, injury rehab, women's training, specific sport	Determines which templates he's shown
Where he works	Single select: online only, a specific gym, both	Affects which features he sees
Current client count	Single select: under 5, 5–20, 20–50, over 50	Sets the right plan and teaches you the market

Field	Type	Why you need it
Social accounts	Text (Instagram, TikTok)	His actual channel for new clients

Screen three — business settings (skippable, editable anytime)

Setting	Type	Default
Currency	Single select	Egyptian pound
Packages he sells	A list he adds to: name, duration in days, price	One / three / six months pre-filled and editable
Units	Single select: kg and cm, or lb and inches	kg and cm
Days before expiry to alert me	Number	7 days

The coach's home screen

The first screen after login. It doesn't need to be complex — four things only:

1. **One big button: "Add client".** This is the primary action; make it impossible to miss.
2. **The client list** with photo, name and a colored status indicator: active, expiring soon, expired, and hasn't filled the form yet.
3. **An alert bar at the top**: who is expiring, who filled a form and is waiting on a plan, who missed a check-in.
4. **Three numbers**: active clients, this month's revenue, renewals due this week.

Don't put a chart or a complex dashboard on the home screen. The coach opens the product to do something, not to look at something.

Flow 2 — Creating a client and the form builder

This is the single most important flow in the product. Get this smooth and the coach stays with you.

Step: the coach adds a client

A small screen, two fields:

Field	Type	Required
Client name	Text	✅
Mobile number	Number	✅ (so the link can go out over WhatsApp)
Package	Select from his saved packages	❌ (can be set later)

On save, the system generates a **unique link** for that client and shows the coach two buttons: "Send on WhatsApp" and "Copy link".

Link specification

Property	Decision	Why
Format	`app.com/f/x7k2m9` — short and random	Long and ugly means the client won't trust it
Validity	14 days by default, the coach can extend	A permanent open link is a security hazard
Single use or reusable	Closes after first submission; the coach can reopen it	Prevents tampering
Requires login	❌ No, opens immediately	Any barrier here and the client won't finish
Works on mobile	Mandatory, mobile-first design	95% will open it from WhatsApp on a phone

Important: the form opens without login, but once finished it asks the client to set a simple password or receive an OTP — so he can come back and view his plan later.

The form builder — the coach designs his own questions

The coach starts from a **ready template** and edits it, never from a blank page. The default template contains the questions any coach needs.

Question types to support in version one:

Type	Example use	Note
Short text	Name, occupation	Single line
Long text	"Tell me about your training history"	Large area
Number	Weight, height, age	With its unit beside it
Single select	Gender, activity level, goal	Radio
Multi select	Injuries, conditions, allergies	Checkboxes
Dropdown	Training days available	When there are many options
Date	Date of birth, date of last injury	
Image upload	Measurement photos (front, side, back)	Multiple images
Yes / no	"Do you smoke?", "Do you have a gym membership?"	Faster than a radio
Scale of 1 to 10	Stress level, sleep quality	

For each question the coach sets: **the question text**, **the type**, **required or not**, and an optional **helper line** underneath.

The default template (ship it pre-built)

- Basics: name, age, gender, height, current weight, target weight
- Goal: fat loss, muscle gain, general fitness, injury rehab (single select)
- Experience level: beginner, intermediate, advanced
- Training days available per week and session length
- Training location: gym, home, both
- Injuries and chronic conditions (multi select plus a text field for detail)
- Current medications (text)
- Allergies and foods he won't eat (multi select plus text)
- Preferred number of meals per day
- Sleep quality and stress level (1–10 scale)

- Measurement photos (image upload)

The handoff moment

After the client hits submit:

1. The client sees a thank-you screen with the coach's name and photo and a line: "Your coach will review your data and send your plan within 48 hours."
2. The coach gets a **WhatsApp notification** plus an in-platform notification.
3. The client appears in the coach's list with the status **"Awaiting plan"** in a distinct color.
4. The form data converts automatically into the client's profile, and the measurements enter the tracking table as the first reading.

That last point matters: the data must not be stored as form text and left there — measurements have to be numbers in a table so the charts can work on them later.

Flow 3 — Workout plan builder

The coach opens the client's profile, sees the form answers in a fixed side column (so he isn't navigating back and forth), and builds the plan next to them.

Three ways to start

Method	When he uses it	Effect
From your ready template	First time, or a typical client	Fastest path — edit and done in 5 minutes
From the coach's own template	He has a program he repeats	He must be able to save any plan as his own template
From scratch	A special case	Keep it available, but not the default

The default has to be the template. Open a blank page for the coach and he'll close it and go back to Excel.

Plan structure

A plan is weeks → days → exercises → sets.

Level	Data
Plan	Name, duration in weeks, goal, general notes
Week	Number, whether it's a deload week
Day	Name (e.g. chest and triceps), rest day or not, warm-up and cool-down
Exercise	From the library, order, a coach note specific to this client
Set	Reps, weight or percentage, rest time, RPE

Exercise data in the library

Every exercise carries:

Field	Type	Note
Arabic name	Text	This is what the client sees
English name	Text	This is usually what the coach searches by
Primary muscle	Single select	Used for highlighting and filtering
Secondary muscles	Multi select	
Equipment	Multi select: barbell, dumbbell, cable, machine, bodyweight, bands	The most important filter for a client training at home
Difficulty	Beginner, intermediate, advanced	
Pattern	Push, pull, legs, core, cardio	For quick filtering
Video	Link	
Execution cues	Three short bullets	
Common mistakes	Two bullets	This is what sets you apart

The anatomy illustration

This is the part you asked about specifically. The practical approach:

1. Draw (or buy) **two SVG illustrations** of the human body: front and back.
2. Each muscle group becomes a **separate path in the SVG** with an identifier (`chest`, `lats`, `quads`, `glutes`...). Around 20 groups is enough.
3. In the exercise data, primary and secondary muscles map to those identifiers.
4. At render time: the primary muscle fills dark red, secondaries light red or orange, everything else grey.

The advantage is that you draw the body **once** and it works automatically for every exercise. Don't use a PNG per exercise — that turns two files into 250.

The same illustration gets reused in two other places: the plan summary (which muscles are covered this week and which are neglected), and the client's page.

Video — three levels

Level	Who supplies it	Cost to you
Library video	You, pre-built for each exercise	High, one time
YouTube link	The coach pastes a link	Zero
Direct video upload	The coach films his own	Storage and bandwidth

Start with the first two. Defer direct upload — storage gets expensive fast while you're not yet earning.

If the coach pastes a YouTube link, embed it inside the page rather than linking out. A client who leaves for YouTube gets lost in reels and doesn't come back.

Flow 4 — Nutrition plan builder

Same logic: template first, and macros calculate themselves.

Nutrition plan structure

Level	Data
Plan	Name, calorie target, meals per day, notes
Meal	Name (breakfast, snack, lunch, dinner), approximate time
Food item	From the food database, quantity, unit
Substitute	An alternative item with roughly the same macros

Substitutes matter enormously in the Egyptian market: the client won't find every item every day, and without a substitute he abandons the plan.

Food item data

Field	Example
Arabic name	صدور فراخ مشوية
English name	Grilled chicken breast
Category	Protein, carb, fat, vegetable, fruit, drink, composite dish
Base unit	100 grams
Calories	165
Protein	31 g
Carbs	0 g
Fat	3.6 g
Fiber	0 g
Alternative units	Medium piece = 120 g, cup = 140 g

Those **alternative units** are what makes the difference. No Egyptian client is going to weigh his food in grams. He has to be able to pick "a loaf", "a cup", "a tablespoon", "a piece" — and the system converts to grams itself.

Automatic calculation

The coach picks the item and quantity, and the system immediately calculates and displays:

1. **Meal total** — calories, protein, carbs, fat.
2. **Day total** — updating with every addition.
3. **Gap to target** — "18 g of protein short" in a distinct color.
4. **Macro split** — percentage of each macro against the day's total.

Point three saves the coach the most time. Without it he sits there with a calculator.

Composite dishes

Most Egyptian food is composite dishes rather than single ingredients — koshari, mahshi, molokhia with rice, fatta. Build these as **one item with pre-calculated macros** for an average portion, not as separate ingredients the coach has to assemble.

Koshari, for instance: one item named "koshari", unit "medium plate", macros already calculated. The coach picks it in a second.

That's prep work on your side — but it's exactly what no global platform has.

Flow 5 — Subscriptions and reminders

This is the feature the coach will pay for, even if he won't say so. Everything else he can just about do in Excel — not this.

Subscription data per client

Field	Type	Note
Package	Select from the coach's packages	One month, three months, etc.
Start date	Date	Defaults to today
End date	Calculated automatically	Editable manually
Amount	Number	
Payment status	Paid, partial, overdue	Partial is very common in Egypt

Field	Type	Note
Amount paid	Number	If partial
Payment method	InstaPay, wallet, cash, bank transfer, card	For reporting later
Receipt	Image upload	The transfer screenshot

Subscription states

Five states only, each with a color:

State	When	Color
Active	Within term and paid	Green
Expiring soon	Less than the coach's alert window remaining	Yellow
Expired	Past the end date	Red
Frozen	The coach froze it (travel, injury, Ramadan)	Grey
Payment overdue	Within term but the amount is short	Orange

Freezing isn't a nice-to-have — it happens constantly in Egypt (travel, exams, Ramadan). Without it the coach goes back to calculating by hand.

Automatic reminders

Alert	To whom	When	Channel
Subscription expiring	Coach	7 days before the end (configurable)	In-platform + WhatsApp
Subscription expiring	Client	3 days before the end	WhatsApp
Subscription expired	Both	On the end date	WhatsApp
Payment overdue	Coach	3 days after it's due	In-platform

Alert	To whom	When	Channel
Client has gone quiet	Coach	Missed two check-ins in a row	In-platform

The renewal message to the client should be **written and edited by the coach once**, then sent automatically with the client's name and expiry date filled in.

The payments screen

One screen for the coach: every payment sorted by date, this month's total, overdue amounts, and filters by client and payment method. Plus an Excel export button.

That export button is small but builds a lot of trust — the coach feels his data is his and not locked inside you.

Flow 6 — Recurring check-ins

The check-in is what keeps the client inside the platform after he receives his plan. Without it, the client takes the plan and disappears.

Check-in setup

The coach sets, per client:

Setting	Options	Default
Frequency	Daily, every other day, weekly, fortnightly	Weekly
Day	If weekly: which day of the week	Friday
Time	Hour the reminder goes out	8 AM
Questions	Picked from the check-in question library	Weight + photos + adherence

Suggested check-in questions

Question	Type	Suitable frequency
Current weight	Number	Every time

Question	Type	Suitable frequency
Measurement photos	Image upload	Weekly
Measurements (waist, chest, arm)	Numbers	Fortnightly
Days you stuck to the nutrition plan	Number 0 to 7	Weekly
Days you trained	Number	Weekly
Sleep quality	1–10 scale	Every time
Energy level	1–10 scale	Every time
Any pain or injury	Yes/no + text	Every time
Anything you want to tell me	Long text	Every time

The flow

1. At the scheduled time, the client receives a WhatsApp message with a check-in link.
2. He fills it in under two minutes — this is a requirement; any longer and he'll drop it.
3. The coach sees the response in a "New check-ins" list sorted newest first.
4. The coach replies with a written comment or a voice note.
5. Weight and measurements enter the tracking table automatically and update the charts.

Progress view

Coach and client both see the same page:

- **Weight chart** over time, with the target line.
- **Measurement charts** for each measurement separately.
- **Comparison photos** side by side: the first and the most recent.
- **Adherence rate** over the last four weeks.

Those comparison photos are the strongest renewal driver you have. When the client sees the difference with his own eyes, renewing becomes an easy decision.

Photo privacy

Measurement photos are the most sensitive data in the whole product. Three rules:

1. Separate, encrypted storage — not the same place as other files.
2. Time-limited links, not permanent URLs that anyone who copied them can open.
3. The client can delete his photos at any time, and they disappear from the coach's side too.

A leak of client photos ends the product in a single day. Take this part seriously from the first line of code.

Flow 7 — Analytics

There are three levels of analytics, each for a different audience. Don't mix them into one screen.

1. Client analytics (the client sees these)

One purpose: make him feel progress so he renews.

- Weight over time with the target line
- Measurements over time
- Before-and-after photos
- Adherence rate for training and nutrition
- Number of weeks completed

Don't show him many numbers. Three charts and two photos is enough.

2. Coach analytics for a single client

Purpose: decide whether to adjust the plan.

- Everything above
- Weekly rate of weight change (is the pace right for the goal?)
- Exercises he consistently skips
- Which days he sticks to and which days he slips
- Date of the last check-in

3. Coach business analytics (this is what keeps him subscribed)

Purpose: understand his work as a business for the first time in his life.

Metric	Why it matters
This month's revenue and the last six months	First time he sees his number plotted
Active clients over time	Growing or eroding?
Renewal rate	The one metric that determines the future of his business
Average client lifetime	He learns a client's real value
Average revenue per client	He decides whether to raise prices
At-risk clients	Who missed check-ins and is likely to leave
Client source	Instagram, referral, ads — if he logs it

The "at-risk clients" metric is the most important one. It turns the platform from a record-keeper into a tool that makes money: the coach calls the client before he leaves, not after.

4. Your own analytics (not in the product, but collect them)

Internal data for you, to understand your product:

- How many coaches created an account and how many actually added a client (your single most important number)
- Average time from signup to first client
- How many forms were sent and how many were completed (completion rate)
- Which question type gets removed from the template most often
- Which exercises and which foods get used most
- At which step coaches stop and don't continue

That first number — the share who added a client — tells you whether the product works. Everything else is secondary.

Edge cases to handle

These are what break products after launch. Account for them while designing the database, not afterwards.

Case	What happens	Suggested decision
Client opened the link but didn't finish	A half-filled form	Autosave at every step, and send one reminder after 24 hours
Client won't fill a form	Refuses or doesn't understand	The coach can fill the form on his behalf
A client with more than one coach	Same number in two accounts	Many-to-many from day one, not an account per coach
Client changed his number	Lost access	Allow email login as a fallback
Coach deleted a client	Plans and history	Soft delete — hide it, don't erase it; he may want it back
Subscription expired but the client still logs in	Does he see the plan?	He sees his history and data, not a new plan — plus a renewal message
Coach froze the subscription	How do dates recalculate	Frozen days are added to the end date automatically
An exercise was removed from the library	Old plans contain it	Never delete an exercise used in a plan — deactivate it instead
Coach edited a template	Plans built from it	A template is a copy; editing it doesn't affect existing plans
Client uploaded an enormous photo	Slowness and storage	Compress images client-side before upload
Coach is offline	Gym wifi is weak	At minimum, viewing the plan should work offline
One client with more than one plan	Old and new	A plan has a state: draft, active, ended — only one active

An important design decision

Make **everything the coach builds saveable as a template**: the plan, the form, the renewal message, the check-in questions. It's the cheapest feature in the product and the highest-value one, because the more the coach uses the platform the harder it becomes to leave.

What to actually build first

If you're starting code tomorrow, build this flow in this order and nothing more:

1. Coach signup (three fields).
2. Add a client and generate a link.
3. A form with a fixed template (no form builder yet).
4. The coach views the answers.
5. A subscription with a start date, end date and alert.

Five steps. If those work well and five coaches use them weekly, you have a product. The form builder, the plan builders and nutrition all come after that.
